PTM: The N-terminus is blocked.

MISCELLANEOUS: Optimal pH is 7.0-7.5 with ATP as substrate and 7.5-8.0 with ADP.

7.5-8.0 with ADP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Palmitoylation targets CD39/endothelial ATP diphosphohydrolase to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               J. Biol.: Chem. 275:2057-2062 (2000).

J. Biol.: Chem. 275:2057-2062 (2000).

In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could a nucleotides to regulate purinergic neurotransmission. Could a be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.

CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.

CATALYTIC ACTIVITY: AIP + 2 H(2)0 = AMP + 2 phosphate.

CATALYTIC ACTIVITY: AIP + 1 H(2)0 = AMP + 2 phosphate.

AUBUNIT: Homodimer; disulfide-linked (By similarity).

                                                                                                                                                                                                                                                             Neuropharmacology 36:1189-1200(1997).

-!- FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the pervention of platelet aggregation. Hydrolyzes ATP and ADP equally well.
-!- CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.
-!- COFACTOR: Requires calcium and magnesium.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
-!- SUBCELLULAR EQCITY: Expressed in primary neurons and astrocytes, kidney, liver, muscle, thymus, lung and spleen.
                                                                                                                                                                    STRAIN=Sprague-Dawley; TISSUE=Brain; MEDI=10.1016/S0028-3908(97)00115-9; MEDI=15=15.2 Zimmermann H.; PubMed=9364474; DDI=10.1016/S0028-3908 (97)00115-9; Kegel B., Braun N., Heine P., Maliszewski C.R., Zimmermann H.; Man ecto-ATPase and an ecto-ATP diphosphohydrolase are expressed in

Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP equally well.

-!- CATALYTIC ACTIVITY: ATP + 2 H(2)0 = AMP + 2 phosphate.

-!- COFACTOR: Requires calcium and magnesium (By similarity).

-!- SUBGNIT: Homodimer; disulfide-linked (By similarity).

-!- SUBCLIULAR LOCATION: Integral membrane protein (Potential).

-!- TISSUB SPECIFICITY: Highest expression found in vascular endothelium, smooth muscle, spleen and lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diphosphohydrolase.", J. T diphosphohydrolase.";

J. Balol. Chem. 271:33116-33122 (1996).

C -!- FUNCTION: In the nervous system, could hydrolyze ATP and other

nucleotides to regulate purinergic neurotransmission. Could also

be implicated in the prevention of platelet aggregation.

Hydrolyzes ATP and ADP equally well.

C -!- CATALYTIC ACTIVITY: ATP + 2 H(2) O = AMP + 2 phosphate.

C -!- COFACTOR: Requires calcium and magnesium.

-!- COFACTOR: Requires calcium and magnesium.

-!- SUBGELJULAR LOCATION: Integral membrane protein (Potential).

-!- SIMILARITY: Belongs to the GDA1 / CD39 NTPase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Could also

J. Biol. Chem. 272:23645-23652(1997)

J. Biol. Chem. 272:23645-23652(1997)

L. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Could also be implicated in the prevention of platelet aggregation. Hydrolyzes ATP and ADP 42 H(2)O = AMP + 2 phosphate.

C. -- COFACTOR: Requires calcium and magnesium (By similarity).

--- SUBUNIT: Homodimer; disulfide-linked (Probable).

--- SUBCELLULAR LOCATION: Integral membrane protein (Potential).

C. --- PIM: N-glycosylated.

--- SIMILARITY: Belongs to the GDA1 / CD39 NTPase family.
                                                                                                                                                                                                                                                 Could also

The present sequence is the fusion protein construct, pILZLTriml. This construct comprises of the leader peptide from human interleukin 2 (hILZ) and soluble CD39 (solCD39) protein region, having apyrase activity. The two regions are joined by an intervening Ala residue. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It constructed by removing the N- and C-terminal transmembrane domains. It cratains the capacity to metabolise APP and ADP at relevant concentrations of and the ability to block and reverse ADP-induced platelet activation and crecuitment, including platelet aggregation. Soluble CD3 polypeptides or excutiment, including platelet aggregation. Soluble CD3 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of are useful for inhibiting angiogenesis. It is useful for the treatment of constant about a throwed and vascular occlusion, or injury, embolism, atherosclerosis, peripheral vascular occlusion, pulmonsy and cerebral artery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary companies than partial partery thrombosis (DVT), pulmonary companies of pramation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.
                                                                                                Claim 6; Page 111-112; 122pp; English.

Protein encoded by Trim 1 construct.

17-AUG-2000 (first entry)

AAY70899,

AAY70899 standard; protein; 464 AA

```
The present sequence is the protein encoded by Triml construct. pIL2Triml CC variant was constructed by removing the human IL2 residues from solCD39 creation construct. Fusion of 12 amino acids from the N.terminus of mature tusion construct. Fusion of 12 amino acids from the N.terminus of mature construct. Fusion of 12 amino acids from the N.terminus of mature construct. Fusion of 12 amino acids from the N.terminus of mature construct. Fusion of 12 amino of 12 amino of 12 amino of 12 amino of 12 amino of 13 amino of 13 amino of 13 amino of 13 amino of 13 amino of 13 amino of 13 amino of 13 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of 14 amino of

The present sequence is a fusion construct, comprising the N-terminal amino acids of mature human interleukin2 (IL2) and soluble CD39 (solCD39) region, that has apyrase activity. This results in high levels of solCD39 cexpression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It creains the apparetty to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides creatistable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, coronary and cerebral ischaemic disorders including lung, coronary and cerebral ischaemic dischaemic disorders including coronary, peripheral and cerebral artery thrombosis (intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (intracardiac and venous thrombosis (intracardiac and venous thrombosis (intracardiac and venous for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The present sequence is the protein enocoded by a fusion construct of sol(soluble) CD39 having apyrase activity. Fusion of 12 amino acids from the N-terminus of mature human II2 to the solCD39 coding region results in high levels of mature human II2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is used in the treatment of unstable angina, athorosclerosis, peripheral vascular occupary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precelampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary actery thrombosis, erreny thrombosis, thrombosis, intracardiac thrombosis, peripheral artery thrombosis, wencus thrombosis, intracardiac thrombosis, cosquiopathy, deep venous thrombosis (bryf), pulmonary embolism (PE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or
                            unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclerosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; lung ischaemia; thrombolytic; cerebral ischaemia; thrombotic disorder; coronary artery thrombosis; peripheral artery thrombosis; intracardiac thrombosis; venous thrombosis; peripheral artery thrombosis; coagulopathy; deep venous thrombosis; pripheral artery thrombosis; restaemic attack; thrombos formation; occlusion; reacclusion; stenosis; restaemic attack; thrombus formation; cerebroprotective; antiateriosclerotic; vasotropic; anticoagulant; coronary ischaemia; vascular occlusion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39

```
This construct comprises of the leader peptide from human immunoglobulin of kappa, linked to the soluble CD39 (solCD39) protein region by few residues derived from human interleukin 2 (h1L2). SolCD39 has apyrase activity and is constructed by removing the N- and C-terminal relevant concentrations and the ability to metabolise ATP and ADP in the concentrations and the ability to block and reverse ADP- induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angregation. Soluble CD39 polypeptides are useful for inhibiting myocardial infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, preeclampsia, platelet associated ischaemic disorders including lung, coronary and cerebral schaemic disorders including coronary, peripheral and cerebral artery thrombosis, intracardiac and venous thrombosis, intracardiac and venous thrombosis, intracardiac and venous thrombosis, cranslent ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present sequence is the fusion protein construct, IgkappaLsolCD39
                                                                                                                                                                                                                                                                                                             New soluble CD39 polypeptides having apyrase activity, useful for inhibiting angiogenesis and treating unstable angina, myocardial infarction, stroke, coronary artery disease or injury.

Gayle RB, Marcus AJ; Maliszewski CR,

(IMMV) IMMUNEX CORP. (CORR) CORNELL RES FOUND INC.

13-AUG-1999;

WPI; 2000-339518/29.

Inhibiting platelet activation and recruitment, useful for treating a mammal suffering from unstable angina, myocardial infarction, stroke, coronary artery disease or injury, comprises administering soluble CD39 polypeptides.

Claim 6; Page 116-118; 118pp; English.

The present sequence is the protein encoded by IgkappaLsolCD39 construct. This is used for transient expression of soluble (sol)CD39 in recombinant cells for determining enzymatic activity and platelet inhibitory activity for each protein product. SolCD3 is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, thrombosis, coopalopathy, deep venous thrombosis (DVT), pulmonary embolism (PB), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke SD;

The present sequence is the fusion protein construct, pIL2LTrim4. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble (D139) (solCtein region, having apprase activity.

Coluble (D139) is constructed by removing the N- and C-terminal constructed by removing the N- and C-terminal constructed by removing the N- and C-terminal constructed by removing the N- and C-terminal concentrations and the ability to block and reverse ADP- induced platelet activation and recruitment, including platelet agregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, stroke, myocardial infarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, preeclampsia, platelet- is cassociated isohemic disorders including lung, coronary and cerebral cerebral artery thrombosis infracardiac and venous thrombosis, coronary, peripheral and cerebral artery thrombosis infracardiac and venous thrombosis, coronary embolism (PB) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 KVNEIGIYLTDCMERAREVIPRSQHQETPVYLGATAGMRLLRMESEELADRVLDVVERSL 120

Pusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high lavels of mature expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral schaemia, a thrombosis intracardiac thrombosis, peripheral artery thrombosis, thrombosis, coaquilopathy, deep venous thrombosis, thrombosis, coaquilopathy, deep venous thrombosis (DE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or

                                                                                                                                                                                                                                                                                                                                              The present sequence is the fusion protein construct, pIL2LTrim3. This construct comprises of the leader peptide from human interleukin 2 (hIL2) and soluble CD39 (solD039) protein region, having apprase activity.
Soluble CD39 is constructed by removing the N- and C-terminal
transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant broncentrations and the ability to block and reverse ADP are relevant broncentration and recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angoradial inflarction, coronary artery disease or injury, embolism, atherosclerosis, peripheral vascular occlusion, precelampsia, platelet associated ischaemic disorders including lung, coronary and cerebral associated ischaemic disorders including lung, coronary and cerebral cerebral artery thrombosis, intracardiac and venous thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PS) and trombus formation or reformation, reocclusion, stenosis or transment seriors of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         214

The present sequence is the protein encoded by Trim3 construct. pIL2Trim3 variant was constructed by removing the human IL2 residues from solCD39 fusion construct. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. SolCD39 is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, ablatelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral schaemia, a thrombotic disorder including coronary artery thrombotic disorder including coronary artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, thrombosis, coagulopathy, deep venous

The present sequence is a fusion protein construct CD39-L4-1, comprising the human CD39-L4 N-terminal region and soluble CD39 protein. CD39-L4 is a secreted apyrase, belonging to the CD39 family. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the ability to block and reverse ADP-induced platelet activation and recruitment, including platelet aggregation. Soluble CD39 polypeptides crecruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary attery disease.

CC unstable angina, myocardial infarction accounts are consisted including coronary, coronary and cerebral ischaemia, thrombosis intracardiac and venous thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB) and transient ischaemia entack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, teocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 120

Soluble CD39; solCD39; human; apyrase activity; platelet activation; unstable angina; myocardial infarction; stroke; coronary artery disease; atherosclarosis; peripheral vascular occlusion; preeclampsia; embolism; platelet-associated ischaemic disorder; thrombotic disorder; reocclusion; coagulopathy; deep venous thrombosis, DVT; pulmonary embolism; PE; thrombus formation; occlusion; restenosis; angiogenesis; antianginal; cerebroprotective; antiateriosclerotic; anticoagulant; cardiant; vasotropic; thrombolytic; inhibitor; interleukin 2; IL2.;
platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and cerebral ischaemia, thrombotic disorder including coronary artery thrombosis, cerebral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, venous thrombosis, thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PB), translent ischaemic attack. Soluble CD19 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          KVNEIGIYLTDCMERAREVIPRSQHQETPVYLGATAGMRLLRMESEELADRVLDVVERSL 120

CD39-L4 is a secreted apyrase belonging to the CD39 family. The fusion construct is used for the expression and activity of soluble CD39 in CHO (chinese hamster ovary) cells. Soluble CD39 retains the capacity of wildtype CD39 to metabolise ATP and ADP at physiologically relevant concentrations as well as the ability to block and reverse ADP-induced platelet activation and recruitment including platelet aggregation. This is used in the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, preeclampsia, embolism,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a fusion construct pIL2LsolCD39, comprising the leader peptide of human interleukin 2 (hIL2), 12 amino acids from the mature N-terminus of hIL2 and soluble CD39 (solCD39) coding region, having apyrase activity. This produces high levels of solCD39 expression and activity in the transfected cells. Soluble CD39 is constructed by removing the N- and C-terminal transmembrane domains. It retains the capacity to metabolise ATP and ADP at relevant concentrations and the recruitment, including platelet aggregation. Soluble CD39 polypeptides are useful for inhibiting angiogenesis. It is useful for the treatment of unstable angina, myocardial infarction, stroke, coronary artery disease or injury, atherosclerosis, peripheral vascular occlusion, precclampsia, embolsem, platelet-associated ischaemic disorders including lung, coronary, coronary, and gerebral ischaemia, thrombotic disorders including coronary,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      peripheral and cerebral attery thrombosis, intracardiac and venous thrombosis, coagulopathy, deep venous thrombosis (DVT), pulmonary embolism (PE) and transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, reocclusion,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           KVNEIGIYLTDCMERAREVIPRSQHQETPVYLGATAGMRLLRMESEELADRVLDVVERSL 120

The present sequence is protein encoded by the coding region of prize pilzsolCD39, a fusion construct encoding sol(soluble)CD39 having apyrase of pilzsolCD39, a fusion construct encoding sol(soluble)CD39 having apyrase activity. Fusion of 12 amino acids from the N-terminus of mature human IL2 to the solCD39 coding region results in high levels of both expression and activity in the supernatants of transfected cells. This is coronary arthry disease or injury, atherosclerosis, peripheral vascular coclusion, preeclampsia, embolism, platelet-associated ischaemic disorder including lung ischaemia, coronary ischaemia and certebral ischaemia, a thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, intracardiac thrombosis, peripheral artery thrombosis, corollopathy, deep venous thrombosis, venous plumonary embolism (PE), transient ischaemic attack. Soluble CD39 is also useful for preventing thrombus formation or reformation, occlusion, creclusion, stenosis or restenosis of blood vessels or stroke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             338

The present sequence is the active fragment of human CD39. CD39 or its active fragment may be administered to treat or prevent stroke in a subject susceptible to intracranial haemorrhaging or an ischaemic disorder. The CD39 pollypeptide inhibits ADP-mediated platelet aggregation or leukocyte accumulation and/or ATP by increasing ADP catabolism to the subject. CD39 or its active fragment is useful for treating or preventing stroke, thrombotic disorders and ischaemic disorders such as peripheral vascular disorder, pulmonary embolus, venous thrombosis, myocardial infarction, transient ischaemic attack, unstable angina, reversible ischaemic neurological deficit and sickle cell anaemia. It is also useful for treating or preventing a stroke disorder in a subject undergoing heart surgery, lung surgery, spinal surgery, brain surgery, vascular surgery, abdominal surgery, or organ transplantation surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            KTSYAGVKEKYLSEYCFSGTYILSLLLQGYHFTADSWEHIHFIGKIQGSDAGWTLGYMLN 421
